

# Password Hashing Application

## Agile Methodology

### Grooming:

#### Password Hashing Application Specification

#### Details:

- When launched, the application should wait for http connections.
- It should answer on the PORT specified in the PORT environment variable
- It should support three endpoints:
  - A POST to /hash should accept a password. It should return a job identifier immediately. It should then wait 5 seconds and compute the password hash. The hashing algorithm should be SHA512
  - A GET to /hash should accept a job identifier. It should return the base64 encoded password hash for the corresponding POST request.
  - A GET to /stats should accept no data. It should return a JSON data structure for the total hash request since the server started and the average time of a hash request in milliseconds.
- The software should be able to process multiple connections simultaneously.
- The software should support a graceful shutdown request. Meaning, it should only allow any in-flight password hashing to complete, reject any new requests, respond with a 200 and shutdown.
- No additional password requests should be allowed with shutdown is pending.

#### Questions:

What is min/max length of password

I tested as though min and max were 8-12.

Are special characters allowed

I tested as though special characters are allowed including double byte

Is empty string allowed

I tested as though empty string is not allowed

Are there password minimum requirements

I tested as though there are no minimum requirements

#### Story Points:

As a team calibrate on how big the work is

Committed into sprint:

As Developer is writing application – QA writes test cases – and asks developer to approve test cases. – This is so developer knows what QA is looking for, and QA isn't missing anything. – This is also where I would communicate with DEV ask questions

- I wrote test cases to cover details given in the story
- I wrote my test cases to cover good and bad responses
- Added tests to test for length, empty string, special characters, all upper case, and all lower case, double byte characters, only numbers.
- Added test case to test if POST takes more than just "password"
- Added test case to test invalid identifier
- Test graceful shutdown

In Testing:

Execute approved test cases in test cycle

I used JIRA and made a story and linked tested cases using Zephyr Scale and executed.

1. Password Hashing Application – Correct Port

- a. PASS
- b. Validated have to have correct port

```
C:\WINDOWS\system32>curl http://127.0.0.1:808/stats
curl: (7) Failed to connect to 127.0.0.1 port 808: Connection refused

C:\WINDOWS\system32>curl http://127.0.0.1:8088/stats
{"TotalRequests":2,"AverageTime":0}
C:\WINDOWS\system32>
```

i.

2. Password Hashing Application – Post to /hash

- a. FAIL
- b. Job identifier is not returned immediately – it takes 5 seconds

```
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey\"}" http://127
curl: (6) Could not resolve host: 127

C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey\"}" -v --trace-time h
.0.0.1:8088/hash
Note: Unnecessary use of -X or --request, POST is already inferred.
13:44:05.375000 * Trying 127.0.0.1...
13:44:05.390000 * TCP_NODELAY set
13:44:05.390000 * Connected to 127.0.0.1 (127.0.0.1) port 8088 (#0)
13:44:05.390000 > POST /hash HTTP/1.1
13:44:05.390000 > Host: 127.0.0.1:8088
13:44:05.390000 > User-Agent: curl/7.55.1
13:44:05.390000 > Accept: */*
13:44:05.390000 > Content-Length: 26
13:44:05.390000 > Content-Type: application/x-www-form-urlencoded
13:44:05.390000 >
13:44:05.406000 * upload completely sent off: 26 out of 26 bytes
13:44:10.390000 < HTTP/1.1 200 OK
13:44:10.406000 < Date: Thu, 25 Mar 2021 19:44:10 GMT
13:44:10.421000 < Content-Length: 1
13:44:10.437000 < Content-Type: text/plain; charset=utf-8

13:44:10.453000 * Connection #0 to host 127.0.0.1 left intact
```

i. C:\Users\jbhan\Desktop>\_

### 3. Password Hashing Application – GET to /hash

- PASS
- Get command takes ID

```
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey\"}" http://127.0.0.1:
6
C:\Users\jbhan\Desktop>curl -H "application/json" http://127.0.0.1:8088/hash/6
NN0PAKtiEayiT8/Qd53AeMzHkbvZDdwYYiDnwtDdv/FIWvcy1sKCb7qi7Nu8Q8Cd/MqjQeyCI0pWKD6p74A1g==
C:\Users\jbhan\Desktop>_
```

### 4. Password Hashing Application – GET stats

- FAIL
- It is not returning average time in milliseconds

```
C:\Users\jbhan\Desktop>curl -v http://127.0.0.1:8088/stats
* Trying 127.0.0.1...
* TCP_NODELAY set
* Connected to 127.0.0.1 (127.0.0.1) port 8088 (#0)
> GET /stats HTTP/1.1
> Host: 127.0.0.1:8088
> User-Agent: curl/7.55.1
> Accept: */*
>
< HTTP/1.1 200 OK
< Date: Thu, 25 Mar 2021 19:48:15 GMT
< Content-Length: 35
< Content-Type: text/plain; charset=utf-8
<
{"TotalRequests":8,"AverageTime":0} * Connection #0 to host 127.0.0.1 left intact

C:\Users\jbhan\Desktop>curl -v --trace-time http://127.0.0.1:8088/stats

7
C:\Users\jbhan\Desktop>curl http://127.0.0.1:8088/stats
{"TotalRequests":9,"AverageTime":0}
C:\Users\jbhan\Desktop>_
```

i.

5. Password Hashing Application – Multiple Connections

- a. PASS
- b. Able to send POST from multiple command windows

```
{ "TotalRequests":9, "AverageTime":0}
C:\Users\jbhan\Desktop>curl http://127.0.0.1:8088/stats
{"TotalRequests":9,"AverageTime":0}
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey\"}" http://127.0.0.1:8088
8
C:\Users\jbhan\Desktop>curl http://127.0.0.1:8088/stats
{"TotalRequests":12,"AverageTime":0}
C:\Users\jbhan\Desktop>
C:\WINDOWS\system32>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey2\"}" http://127.0.0.1:8088
9
C:\WINDOWS\system32>
C:\WINDOWS\system32>curl -X POST -H "application/json" -d "{\"password\":\"angrymonkey1\"}" http://127.0.0.1:8088
10
i.
```

6. Password Hashing Application – Post to /hash max length

- a. Marked as pass – this is assuming it was agreed and coded to be set to 15 and correct response was returned

7. Password Hashing Application – Post to /hash min length

- a. Marked as pass – this is assuming it was agreed and coded to be set to 5 and correct response was returned

8. Password Hashing Application – Post to /hash empty string

- a. Marked as pass – this is assuming it was agreed and coded to not accept empty strings and correct response was returned

9. Password Hashing Application – Post to /hash special characters

- a. Marked as pass – this is assuming it was agreed and coded to accept special characters and correct response was returned

```
12
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"!@#%*\"}" http://127.0.0.1:8088
13
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\"Niña\"}" http://127.0.0.1:8088
14
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"password\":\" \"}" http://127.0.0.1:8088/h
15
i. C:\Users\jbhan\Desktop>_
```

10. Password Hashing Application – Post to /hash upper characters

- a. Marked as pass – this is assuming it was agreed and coded to allow only upper characters and correct response was returned

11. Password Hashing Application – Post to /hash lower characters

- a. Marked as pass – this is assuming it was agreed and coded to allow only lower characters and correct response was returned

12. Password Hashing Application – Post to /hash numbers only

- a. Marked as pass – this is assuming it was agreed and coded to allow only numbers

13. Password Hashing Application – GET to /hash bad ID

- a. Pass
- b. If ID is not known it returns Hash not found

```
16
C:\Users\jbhan\Desktop>curl -H "application/json" http://127.0.0.1:8088/hash/
Hash not found
C:\Users\jbhan\Desktop>_
i.
```

14. Password Hashing Application—Post username to /hash

- a. FAIL
- b. It accepts more than password

i.

```
C:\Users\jbhan\Desktop>curl -X POST -H "application/json" -d "{\"UserName\":\"123.5\"}" http://127.0.0.1:8088/17
C:\Users\jbhan\Desktop>
```

#### 15. Password Hashing Application—GET to /hash/ID before 5 seconds

- a. PASS
- b. Not able to get hashed pw before 5 seconds

```
C:\Users\jbhan\Desktop>curl -H "application/json" -v --trace-time http://127.0.0.1:8088/hash/22

i.

#### In Testing:

While executing test cases, if there are failed items I will either make a task with in the story explaining my findings to be fixed immediately (does not meet acceptance criteria) Or if it is out of scope I will make stories in the backlog to be groomed and fixed at a later date. Stories made will have at minimum environment, test steps, credentials (if needed), screen shots, or screen capture video

#### Send to PO:

Wait for defects to be fixed and sent back to QA. Once all known defects are fixed and re-executed, I would finish up all of my documentation according to definition of done and send story to PO
